

CONDAIR MK5

Resistive steam humidifier
with patented scale management system

Humidification and Evaporative Cooling

 **conda**ir
The new name for JS Humidifiers

Mains, softened or demineralised water

The Condair MK5 can operate on any water quality. When used with a demineralised water supply the humidifier can offer $\pm 1\%RH$ control and requires very little maintenance.

Due to the system's patented scale management system, even when the humidifier is operating with hard water, the scale can easily be removed quickly and efficiently.

Resistive heating elements offer close control

Consistent and accurate humidity control is offered with resistance heater technology. Unlike electrode boiler humidifiers, the water level inside the heating chamber remains constant and the heating elements continue to operate even during mineral dilution cycles. This provides a consistent steam output and accurate humidity control.

Incoloy heating elements with staged operation prevent current peaks on start up. Scale detaches from the elements during operation and falls into the scale collection tank at the bottom of the humidifier for easy removal.

Innovative pumped drain

The drain is located above the scale collector tank so that scale collects in the tank rather than blocking drain pipework.

Condair MK5

Resistive steam humidifier with scale management

Durable casing

Steel powder-coated case with stainless steel option.

Stainless steel boiling cylinder

The Condair MK5 eliminates the expense of disposable plastic boiling cylinders, significantly reducing operating costs.

Electronic float level sensor

Provides reliable water level control.

Easy to control

An ergonomic keypad and backlit display make the Condair MK5 easy to use. Operational status, fault and service requirements are visually indicated.

Continuous control of steam output from 0-100% of its range provides close humidity control.

Scale collector tank

An externally located tank at the bottom of the boiling chamber collects the scale that detaches from the heating elements. It can be drained, removed, emptied of scale and reattached within minutes making essential maintenance quick and simple.

Protection brackets for scale collector tank

The Condair MK5 resistive steam humidifier provides reliable and accurate humidity control with minimal maintenance and without the expense of replaceable boiling cylinders.

Patented scale management technology allows scale deposits to be easily removed from the system quickly and efficiently.

A control accuracy of $\pm 2\%RH$ can be

achieved with mains water or $\pm 1\%RH$ with a demineralised water supply. The system is easy to install with quality, compact construction. The CrNi stainless steel cylinder and Incoloy heating elements are extremely robust and provide a long operational lifetime.

Scale is dislodged from the elements and falls into the scale collector tank

Patented scale management

When operated on mains water all steam humidifiers build up limescale in the boiling chamber as water evaporates. How a humidifier manages this scale determines how easy the system is to use and service. The Condaire MK5's patented scale management system makes it the easiest and most user-friendly steam humidifier in the world, ensuring long operational periods and short maintenance intervals.

Quick and easy to service

Scale that forms on the heating elements cracks off as they expand during operation. The scale then falls into a scale collector tank located at the bottom of the system.

The externally located scale collector tank allows servicing to take place without having to open the humidifier's casing. To remove the scale, the system is drained, then the scale collector tank is unlocked and lowered with its ergonomic handles. The tank is then emptied and reattached allowing the system to be operational again within minutes.

Innovative pumped drain

As scale falls down into the scale collector tank, the drain pump, which is located above the tank, is kept free of scale. Unlike other humidifiers, this avoids blockage of the pump and drainage pipework.

Collected scale is easily removed from the system in minutes

Can connect to a building management system

Remote monitoring and control with e-LINKS.

An optional e-LINKS feature enables the linking of the Condair MK5 to a building management system. Control and monitoring of the humidification system can then be carried out from a PC.

The e-LINKS card allows each humidifier in the system to be individually addressed. The interface is compatible with Modbus, BACnet/IP and LonWorks protocols.

Modbus®

 BACnet™

 LONWORKS

Operates on mains, softened or demineralised water

Flexible water options

The Condair MK5 can operate on mains, softened or demineralised water. When used with mains water the humidifier will provide up to $\pm 2\%RH$ humidity control and up to $\pm 1\%RH$ when used with a demineralised supply.

A demineralised supply will also virtually eliminate scale build-up within the system, reducing maintenance time and operating costs. It also reduces the overall energy

consumption of the humidifier, as the system isn't running dilution cycles to control the water's mineral content, which avoids sending expensive hot water to drain.

Condair manufactures and supplies a wide range of water treatment solutions specifically designed for use with humidification systems.

PureFlo Reverse Osmosis Water Filter

Designed for use with humidification systems such as the Condair MK5

Standard system

- Stainless steel steam cylinder
- Steel powder-coated case
- External scale collector tank
- Control panel
- Self-diagnostic system
- Hours run timer

Accessories

- 1 Steam lance (in-duct)
- 2 Steam hose
- 3 Condensate hose
- 4 Water filter
- 5 Fan distribution system (in-room)

Options

- Stainless steel casing
- OptiSorp short evaporation steam distribution system
- e-LINKS connection to BMS
- Humidity sensors for in-duct/direct room
- Hygrostats
- PureFlo reverse osmosis water filter
